

Section 1

Learning how the real world work always interested me, that's why I study Electro-Optical Engineering for my undergraduate degree in Yuan Ze University, Taoyuan, Taiwan. After I graduated from YZU, I studied Photonics-Optoelectronics in National Taiwan University, Taipei, Taiwan, in particularly researched the behavior of electromagnetic. During the days in NTU, I using lots of programming languages and software tools to simulate electromagnetic, including C++, Python and Matlab. Then, I was attracted by software, I think I can use software to change the world. So, I applied for the Computer System Engineering degree in Northeastern University pursuing my second master degree.

Section 2

Because I love playing sport and listening to music, I started searching the data processing jobs in sports and media industry on *Linkedin* and *Indeed*, particularly involved to machine learning techniques. Later on, I realized that jobs in this industry usually need 3-5 yrs working experiences. So, I started to find data engineering and software engineering jobs in any kinds of industry for my co-op/first job to let me possess the skills, such as SQL, Hive, Spark, and Hadoop and so on. In particularly, I prefer create a product which directly used by customs, so I will find companies such as Amazon, Google, Spotify, or Netflix. It makes me feel severing the world directly.

Section 3

In 5-10 years, I plan to be a senior software/data engineering and lead a group for a product. I'd like to stay in a big company to learn a manage system of running a company. So, in addition to programming skills, like SQL, machine learning algorithm, and so on, I have to learn how to integrate a team and even lead a team in order to make a better product. Then, on the other hand, I will also learn some aspect of financial skills, which is useful for my ultimate goal.

Section 4

For my ultimate goal, I'd like to run my own business, may be involved to sports or music maybe. I will come up with a great idea while I am in the company and find someone else who also have same value of mine to start running the business. The location may not be precise, it may be in Asia, US, or even Europe. It depends on where my business can have more profit, facts like politics or consumers. My major responsibility is to make a blue picture, in other word, CEO. I want to sell a product that can really make people life better, for example, many families are living in different place because of jobs or some outward force. So, in this case, I want using VR or AR to help people live just as their families are nearby. Not only vision but also feeling, which I think can be achieved by holography and some physical technique.
